THE CHALLENGE

**You studied. Your brain forgot.
That is not your fault.**

When you sleep, your brain runs a biological program to permanently store what you learned that day. It works through a three-step sequence: three sequential sleep cycles, four sleep cycles, and five sleep cycles.

When the sequence works, you remember. When it fails, the memory disappears. Not stored somewhere you cannot reach. Actually gone.

Every existing device on the market boosts the quality of whatever the brain randomly decides to replay. None of them have any say in which anyone gets confused about the sleep gap.

THE SOLUTION

**A system that decides which
memories your brain keeps tonight.**

Loci is a 24-hour memory consolidation system designed to actively strengthen how learning becomes long-term memory. Rather than functioning as a sleep tracker that simply observes user behavior, it intervenes directly in the biological processes responsible for memory consolidation.

Through three precisely timed moments distributed across the day and night, Loci targets the mechanisms that transfer newly acquired information into permanent memory storage.

THE PROCESS

01

DURING THE DAY

Mark It.

The Loci wristband monitors your physiological engagement while you study. At peak learning, it flags that memory as high priority and pairs it with a scent anchor.

LOCI BAND DAY

02

DURING REST

Amplify It.

In 10-minute quiet sessions, Loci detects and amplifies the brain's natural memory replay that already occurs during wakefulness. Discovered by Loren Frank, 2013.

LOCI APP

03

DURING SLEEP

Complete the Transfer.

The Loci headband detects the exact millisecond the transfer window opens. Two synchronized signals create the biological conditions. The paired scent is released. The priority memory transfers. Every night.

LOCI BAND NIGHT

THE IMPACT

**A student problem.
A civilizational
mission.**

Loci first helps students who study hard, sleep badly, and forget what they learned by morning, a problem affecting 156M people. But it targets the same memory pathway tied to cognitive decline and Alzheimer's. The student product funds the future clinical system for aging brains.
